M3: Motorola Mismatch Cancellation

- Mismatch is a leading cause of yield loss and a determining factor of circuit performance in analog mixed-signal ICs.
- Motorola has developed a new mismatch model that accounts for variations in physical process parameters and is accurate over geometry and bias.
- The designer need quick, easy access to the new model.
- The model is complex and automation is required.

$$\sigma_{\text{m}}^2 = \sum_j (\partial I_d / \partial p_j)^2 \sigma_{p_j}^2$$

Prior Art

- Prior art based on the simplistic Pelegori model:
 - P. G. Dierman, C. C. McAndrew, "A Comprehensive MOSFET Mismatch Model," 1999 IEEE IEDM.
- Does not have a proper physical foundation and has gross errors in mismatch prediction.
- Prior art can't handle non-traditional devices such as graded channel (GCMOS & halo) and power MOSFETs.
- Inferior commercial tool is available from BTA Technology.

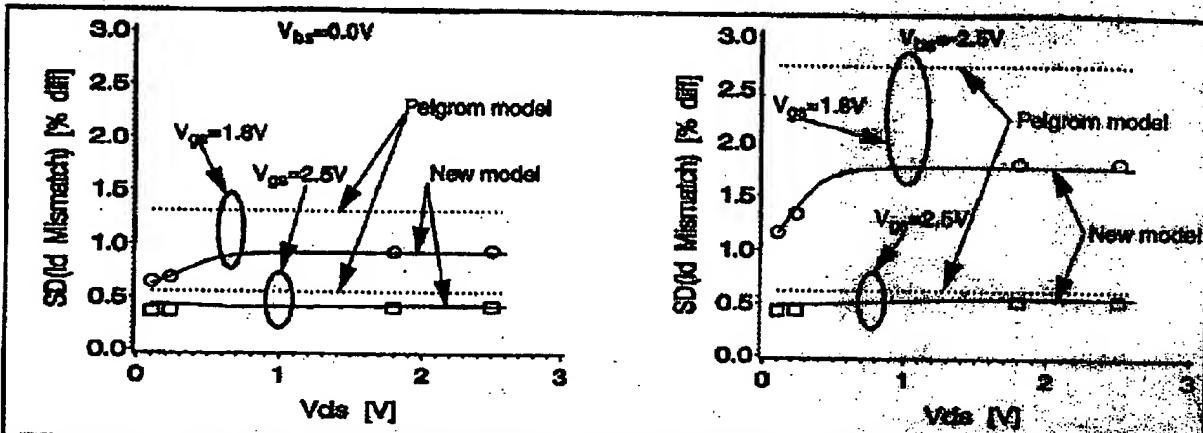

Fig. 1 nMOS I_d mismatch over bias, W/L=7/0.56μm. Circles are data for $V_{gs} = 1.8V$ and squares are for $V_{gs} = 2.5V$.

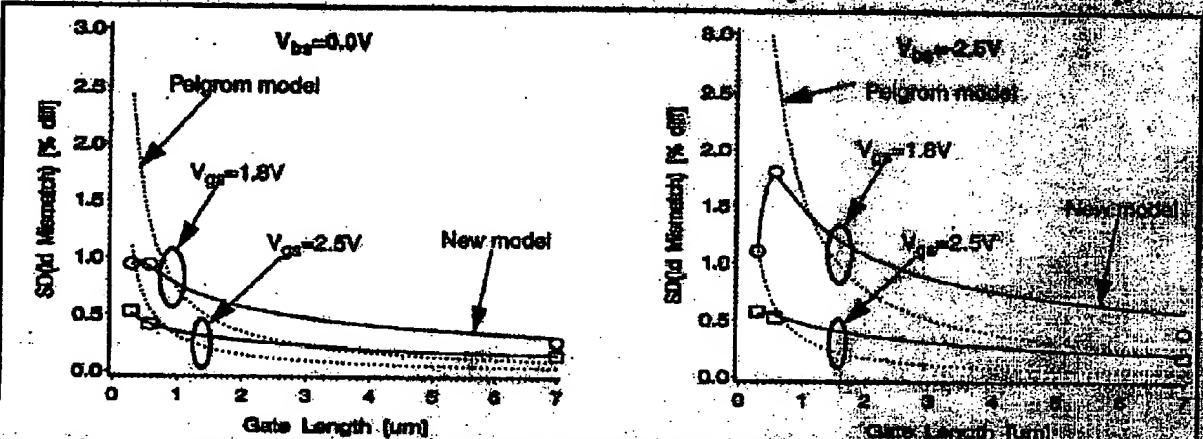

Fig. 2 nMOS I_d mismatch vs. L, W=7μm, $V_{bs} = 2.5V$. Circles are data for $V_{gs} = 1.8V$ and squares are for $V_{gs} = 2.5V$.

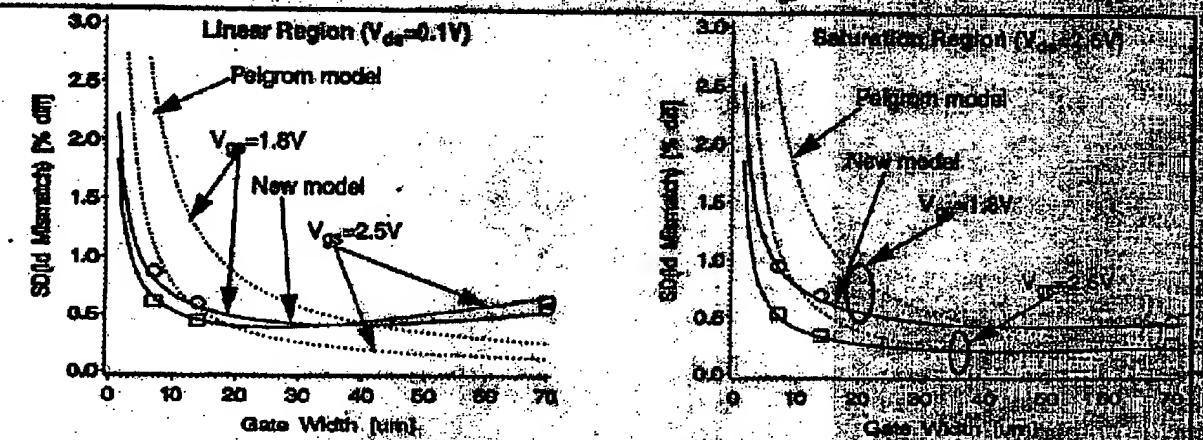

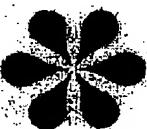

Fig. 3 nMOS I_d mismatch over W, L=0.56μm, $V_{bs} = 0.0V$. Circles are data for $V_{gs} = 1.8V$ and squares are for $V_{gs} = 2.5V$.

M3: Proposed Solution

- Automate the Motorola Mismatch Model in the form of a web-based tool
- Three different solution types
 - Current Mirror (for designers)
 - Differential Pair (for designers)
 - Voltage Driven (for technology developers)
- Make the tool readily available throughout Motorola and only to Motorola
- Perform single mismatch predictions
- Perform multiple mismatch predictions by allowing the designer to sweep over bias and geometry

Sample output

Data generated in to measure:

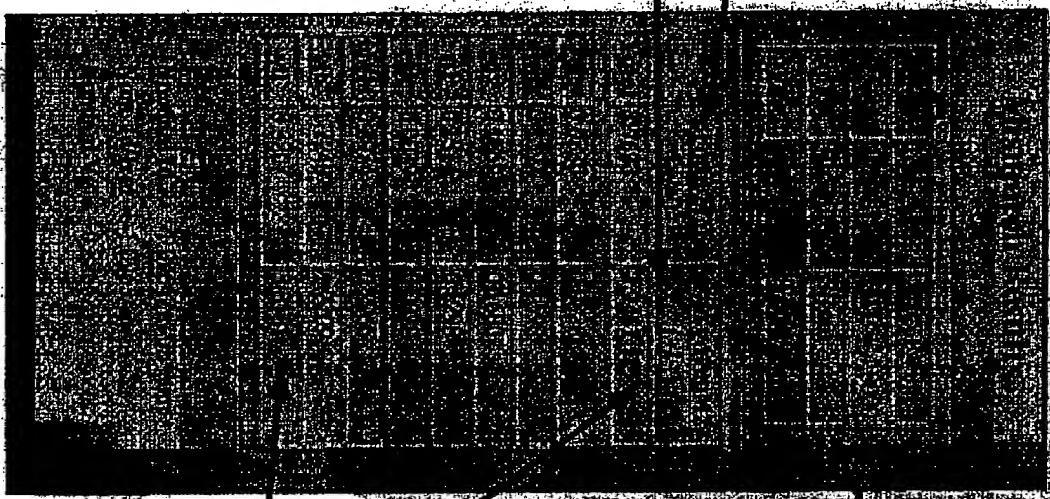

Two Outputs

- Total Mismatch (%)
- Without go
- $V_{D2} = V_g$

Contributions to Mismatch

- Root Sum of Squares, add variances, not standard deviations!
- viii: Accounts for change in flat band voltage as a function of gate length
